

A Winter Gift

How to construct your box

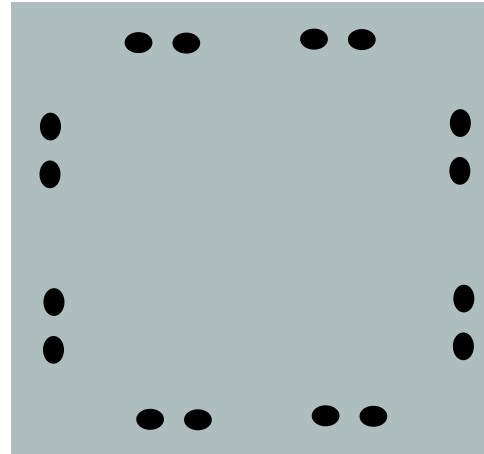

The box construction is a little fiddly but with an electric screwdriver, a little patience and a bit of know how, even an amateur DIYer can have success!

Sides (4)

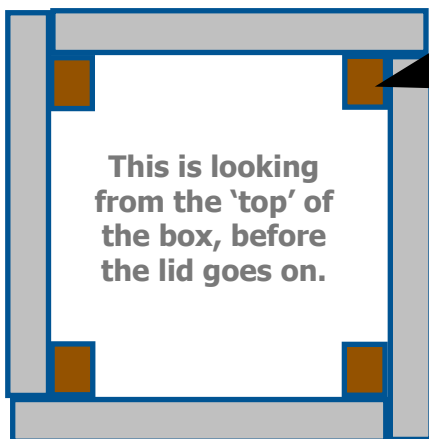

Slightly smaller than the Lid. It has double screws holes on only 3 of the sides.

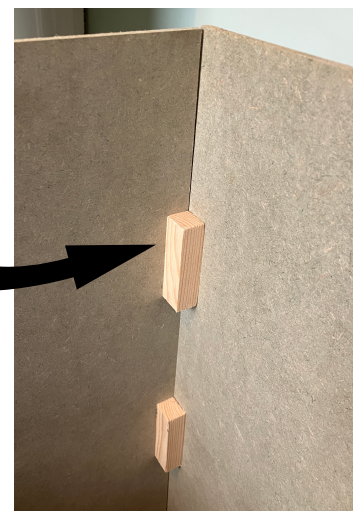

Lid (1)

Slightly bigger than the sides, all four of the edges have the double screw holes.

The pre drilled holes are 'countersunk', in other words if they are the right way round the screw heads sink into the surface of the MDF so they don't show so badly. This should help you get the box the 'right way round'.

The wooden blocks should (JUST) fit the screw holes perfectly if the sides are all lined up correctly

When constructing make sure the 'overlap' is done like this diagram. It means that the box will remain square and the top will fit perfectly!

You may want to bring the boxes 'flat' and construct on the day. Please note there will be limited assistance on the day. Please ensure you bring all the necessary tools with you.
